Not I. The library was constructed according	Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. Denatured RNA was size fractionated on a 1% agarose gel. First strand CDNA synthesis was primed with oligo-dr primer containing a Not I site. Double strand cDNA was	size selected according to mRNA size fraction, ligated with EcoR I adaptor, digested with Not1 and then cloned directionally into pXX-Asc vector. The library tag sequence located between the Not I site and the polyA tail is CGAACHGAAT. This library was created for the Injuversity. /lab host==0.29an: heads; Vector: pBluescript II KS(+); Site_1:
/note==0.09an: heads; Vector: pBluescript II KS(+); Site_1:
ECORI; Site_2: Not1; This normalized library was
constructed from 1 million independent clones. CDNA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand reaction. double-stranded cDNA
was blunted, ligated to NotI adapters, digested with
ECORI, size-selected, and cloned into the NotI and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-923 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

purified by ethanol-precipitation. The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centrion 100. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with Sal1 and Not1 enzymes and cloned into Sal1/Not1 site of pCMV-SPORT6 plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 3.0 kb. The library was constructed by Yulan Piao."

```

VECTOR: PRACE3.6
NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP11-310K15, 2000 bp overlap;
the clone sequenced to the right is RP11-156A1, 2000 bp overlap;
the clone sequenced to the right is RP11-156A1, 2000 bp overlap.
Actual start of this clone is at base position 190775 of
RP11-310K15; actual end is at base position 28935 of RP11-156A1.

(http://bacpac.med.buffalo.edu)

The sequence between 81601 and 81703 is covered only by a pcr product of clone DNA. Unresolved tandem repeat regions exist between 81548 and 83183, 126196 and 127426.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 300; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

Louis Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. I. MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc MAPPING INFORMATION:

restriction digest.

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Berkeley, CA 9472 mustoned as part of a high-throughput process to rhis clone was sequenced as part of a high-throughput process to sequence clones from Drosophila Gene Collection 1 (Rubin et al., Science 2000). The sequence has been subjected to integrity checks for sequence accuracy, presence of a polyA tail and contiguity within 100 kb in the genome. Thus we believe the sequence to reflect accurately this particular cDNA clone. However, there are stifacts associated with the generation of cDNA clones that may have not been detected in our initial analyses such as internal priming, priming from contaminating genomic DNA, retained introns due to reverse transcription of unspliced precursor RNAs, and reverse transcription of unspliced precursor RNAs, and reverse transcription et course that result in single base changes. For further information about this sequence, including its location (http://fruitfly.berkeley.edu.) or send email to change it considered that the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant o

Direct Submission

Submitted (25-JUN-2000) Sanger Centre, Hinxton, Cambridgeshire, Callo 18A, UK. E-maile nequisities: hunquery@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk

On Jul 7, 2000 this sequence version replaced gi:8651879.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence map criteria as follows. An attempt is made to resolve all sequence map criteria sollows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17389 CTGCCTCAGAGATTCCTGAGCAAGGCCCTGTCATCAAGTTCTGGCCCAATGAGAAATGGG 17448

* NOTE: This is a "working draft' sequence. It currently
* consists of 9 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

```
Novel polypeptide designated as CRG-L1, useful as diagnostic marker for liver cancer, is differentially expressed in liver tumors relative to normal liver tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a polypeptide designated as CRG-L1), which is differentially expressed in liver tumours relative to normal expression

                                                                                                                                                                                                                                                                                                                                   9
               encoding polynucleotides (in the case of the human sequence, mapping to chromosome 9p), expression constructs, host cells, anti-CRG-L1 antibodies, identifying modulators of CRG-L1, and the use of the CRG-L1 sequence in the diagnosis of hepatocellular cancer in tumour cells from liver of a human or non-human animal. The CRG-L1 protein and polynucleotide are useful as diagnostic markers for a liver cancer in humans and non-human animals, and as a system for assessing putative therapeutic agents. The present sequence encodes human CRG-L1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TTATTTTCATTTTACCGCCCATCTGCATGTGCTTGTTTGATGAGTATGAGAACATGCTTG

```
The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is 80 % identical to a table of sequences (see ACC5051 to ACC51059). ACC5051 to ACC51059 encode the human bladder cancer-associated proteins given in ABR48146 to ABR48242). Bladder cancer-associated sequences from the present invention have cytostatic activities, and can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is useful in diagnosting or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnostic methods, and for gene therapy, vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GAGGACAACTACACCATCGTGCCTGCTATCGCCGAGTTCTACAACACGGTCAGCAATGTC 120

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
other diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising a
nucleic acid of the invention, antibodies which specifically bind a
polypeptide of the invention, use of such antibodies for drug targeting;
and methods of screening for modulators of activity or expression of the
colypeptides and mucleic acids. The nucleic acids, polypeptides,
antibodies and methods are useful for diagnosing, prognosing and treating
cancer and other conditions such as psoriasis, ischaemia, heart disease,
therosclerosis, inflammatory diseases, autoimmune diseases, retinal
neovascularistaion syndromes, scarring and uterine fibroids. They may
also be useful in wound healing and in contraception. The present

This invention describes novel human ceramidase (I) containing a specific structural motif which has antiproliferative, anticancer, anti-eczema, antipsoriasis and dermatological activity. (I) cleave ceramide, resulting in formation of sphingosine. (I), or the nucleic acid (II) encoding it, are used for diagnosis, prevention or treatment of diseases associated with ceramide defects, particularly altered cell proliferation (cancer) or altered ceramide layers on the skin (neurodermatitis, eczema, psoriasis), also for targeted modification of the permeability barrier by ceramidase or its activators, e.g. for transcutaneous delivery of substances. Specifically they are used for diagnosis of ichthyosis, This sequence encodes human ceramidase K3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ij,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a polypeptide designated as CRG-LII), which is differentially expressed in liver tumours relative to normal expression in normal liver tissues, designated CRG-LII. Also included are the encoding polynucleotides (in the case of the human sequence, mapping to chromosome 9p), expression constructs, host cells, anti-CRG-LI anti-CRG-LI sequence in the diagnosis of hepatocellular cancer in tumour cells from liver of a human or non-human animal. The CRG-LI protein and polynucleotide are useful as diagnostic markers for a liver cancer in humans and non-human animals, and as a system for assessing putative therapeutic agents. The present sequence encodes mouse CRG-LI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polypeptide designated as CRG-L1, useful as diagnostic marker for liver cancer, is differentially expressed in liver tumors relative to normal liver tissues.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel human protein with 3T3 cell conversion promoting function, polynucleotides encoding the polypeptide and the recombinant process of producing the polypeptide. The present invention also discloses the agonist resisting the polypeptide and its treatment effect. The present invention also discloses the application of the polynucleotides encoding the human protein with 3T3 cell conversion
